

1. Unfold the liner, and lay it flat on an even, level surface. Ensure no sharp stones or other debris are under the liner.
2. Insert the legs into the vertical pockets on the outside of the tank. Make sure the circular cut outs are at the top.
3. Assemble the top ring by connecting the poles together end-to-end.
4. Push the top ring into the circular cut outs on the legs. This will require a slight amount of force. **Be careful of sharp edges.**
5. Wrap the flaps around the top ring to secure the liner. Space them out as evenly as possible.
6. The plastic ball valve can be installed at any time, we recommend wrapping PTFE tape (included) around the male threads, this ensures a tight seal and no leaks.
7. Ensure no sharp objects are used or located around the tank. **Keep children away** to prevent the risk of injury or drowning.
